

# CSCB58: Computer Organization

Prof. Gennady Pekhimenko

University of Toronto

Fall 2020

*The content of this lecture is adapted from the lectures of  
Larry Zheng and Steve Engels*

# **CSCB58 Week 1**

# Who are We?

Instructor:

Assistant Professor **Gennady Pekhimenko**

Office: BA5232 and IC454 (normally ;))

[pekhimenko@cs.toronto.edu](mailto:pekhimenko@cs.toronto.edu)

<http://www.cs.toronto.edu/~pekhimenko/>

# Who are We?

TAs:

- Bojian Zheng, PhD student (bojian.zheng@mail.utoronto.ca)
- Qiongsi Wu, MSc. Student (qiongsi.wu@mail.utoronto.ca)
- Anand Jayarajan, PhD student (anandj@cs.toronto.edu)
- Mustafa Quraish, PhD student (mustafa@cs.toronto.edu)

# How to Connect?

- Lectures:

<https://vectorinstitute.zoom.us/j/93537472871> (password: 597255)

- PRA (Mon):

<https://utoronto.zoom.us/j/94009704386> (password: 708254)

- PRA (Tue):

<https://utoronto.zoom.us/j/95205933572> (password: 045630)

- PRA (Thu):

# Today's outline

- **Why** CSCB58
- **What** is in CSCB58
- **How** to do well in CSCB58
  
- Start learning

**Why** take CSCB58?

# “Why are you making me take this?”

- CSCB58 isn't needed if you're just a causal technology user

You can still drive a car, even if you don't understand how the engine works

# “Why are you making me take this?”

- Computer science majors aren't casual technology users  
At the very least, you'll need to know how the programs you write are affected by hardware

# Learning the Magic

# More specifically...

- How do we express 1's and 0's using a piece of silicon?
- How does the computer do everything with just 1's and 0's?
- What is stored in that "fortnite.exe" file, what exactly happens when I double-click on it?
- How does the CPU run an if-statement, or for loop, or recursion?

**CSCB58 has all the answers!**

# After learning CSCB58...

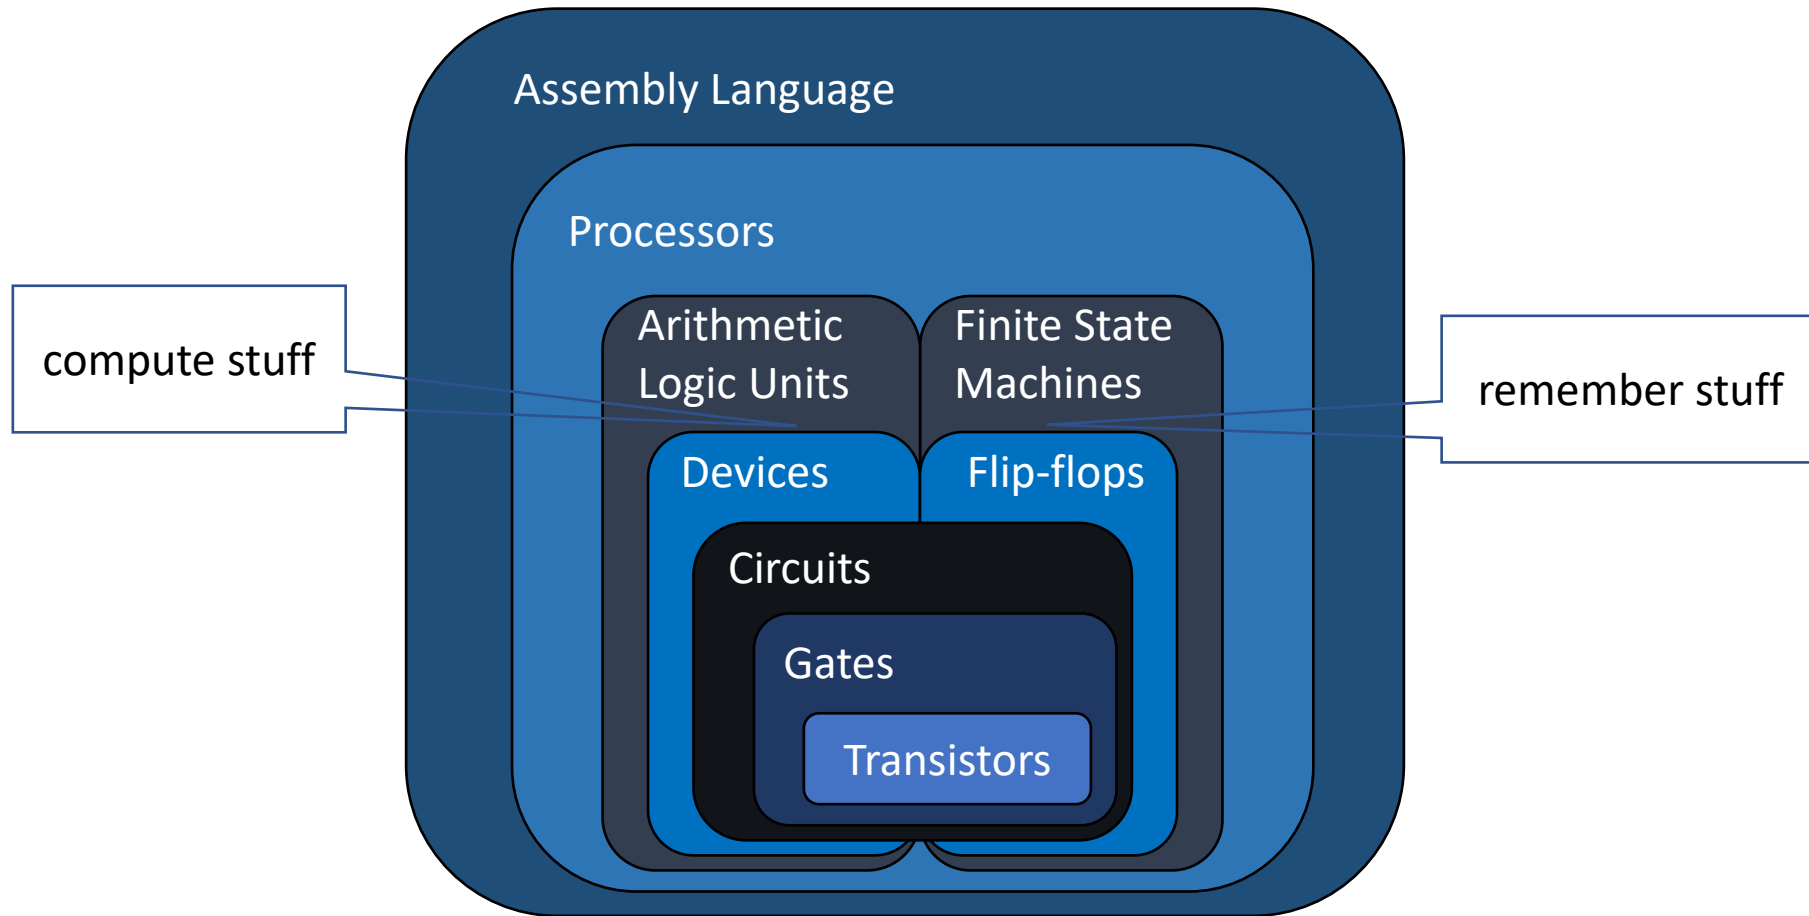

- You'll know everything about how a computer is physically built, and you can build one if you want.
- With your hardware knowledge, you will be able to engineer the performance of your software like never before.

*People who are really serious about software should make their own hardware.*

*-- Alan Kay*

# What's in CSCB58?

# The architecture of a computer **hardware**, level by level, bottom-up

# We learn the whole real deal

- Computing from the ground up:
  - From atom level to assembly level
- Above the assembly level is the Operating System, which **virtualizes** the hardware
- Almost everything you learn from CS courses are **virtualizations/illusions**, except for **CSCB58**

# We learn how to handle **abstractions**

- At each level, we see how the previous layer is *abstracted*
- In the end, we want to know how the underlying hardware affects us as programmers ... so we can ignore the detail.

# **How** to do well in CSCB58

First of all ...

Be interested

# Course website

<https://cscb58f20.ml/>

**All course materials are here**

# Marking scheme

Grades will be based on lab exercises, classroom quizzes, assignment, and the final exam.

<b>Type</b>	<b>Description</b>	<b>Due Date</b>	<b>Weight</b>
Lab	10 weeks	weekly	50% (5% each)
Quiz	Appx. 10 weeks	weekly	10% (appx. 1% each)
Assignment	Assembly project	TBA	15%
Final exam	Take-home; Must get at least 40%	TBA	25%

# Labs (starting from Week 2)

- Hands-on exercises in which you will build real pieces of hardware.
- Pre-labs and in-labs are all done **individually**.
- **ONLY** go to the lab section that you are registered to on ACORN. If you want to switch lab section, find someone who is willing to switch and get permission from Gennady.

# Prelab Reports

- For most of the labs, you will be required to submit a prelab report (a PDF file) to MarkUs before the labs start
- Must be completed **individually**
- Submission deadline is typically before the lab you are taken
- To get the mark for the prelab report
  - do your work and submit something meaningful
  - **don't plagiarize**
  - not submitting anything would be much better than plagiarizing

**SOMEONE GOT SUSPENDED FOR CHEATING**

**ON A 1% PRELAB REPORT**

# Lab software

- We will use Logisim (latest version). NOTE: please, use the version that will be provided/referenced by TAs
- The reference of the software will be (has been) posted on the course website
- **Task for this week: download the software, read the reference, and familiarize yourself with it**

# Weekly Quizzes

- We will use Quercus for online quizzes
- Starting in Week 2 (including **Monday PRA**)
- Useful practices for tests and exams
- Quizzes will be **every Friday in-class** (first **15 minutes**)

# New: Assembly Programming Project

- This year, we'll ask you to write a larger project in assembly than in prior years
- The project will be due on the last day of class
- You will be asked to write assembly code to build a game
  - Memory (storing game state)
  - Syscalls (to access input/output)
  - ...

# Tests

- No midterm
- Final exam
  - Some time end of semester
  - Will be take-home
  - Must get  $\geq 40\%$
  - Details will come later

# Discussion board on Piazza

<https://piazza.com/class/kemxsy9by7o707>

- All course announcements will be posted here.
- **Daily** reading is required.

# Office hours

Fridays, 12pm (please, give heads up/email if you are coming)

# Student Feedback

- Give us frequent (e.g., every week) feedbacks on how things are going. It is very useful for improving your learning experience in a timely manner, especially in a current situation
- Anonymous feedback form:
  - link on the course website
- Or even better, just send me an email

# Textbook: DDCA

Digital Design and Computer Architecture, 2nd edition, 2012 by David Harris, Sarah Harris (1<sup>st</sup> edition also fine)

Available online at UofT library ([Link](#))

# A typical week of CSCB58

- Wednesday/Friday: go to the lectures
- Before your lab: submit prelab report
- Monday/Tuesday/Thursday: labs
- Thursday/Friday morning: next week's lab handout released, start working on the prelab.
- Saturday/Sunday: keep studying ;)

**It will be a lot of work,  
and a lot of fun!**

**COMPUTERS WILL NEVER**

**LOOK THE SAME TO YOU AGAIN**

imgflip.com

# Let the learning begin

# Basic Logic Gates

# You already know something...

# Logic from math course

- Create an expression that is true iff the variables  $A$  and  $B$  are true, or  $C$  and  $D$  are true.

$$G = (A \ \& \ B) \ | \ (C \ \& \ D)$$

$$G = (A \ \& \ B) \ | \ (C \ \& \ D)$$

AND Gate

OR Gate

You just designed your first circuit in CSCB58!

# Gates = Boolean logic

- If we know the logical expression, we already know how to put logic gates together to form a circuit
- Just need to know which logic operations are represented by which gate!

**Let's meet all the gates**

# AND Gates

Truth table

A	B	Y
0	0	0
0	1	0
1	0	0
1	1	1

# OR Gates

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	1

# NOT Gates

A	Y
0	1
1	0

# XOR Gates

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	0

# Bill Gates

# NAND Gates

A	B	Y
0	0	1
0	1	1
1	0	1
1	1	0

# NOR Gates

A	B	Y
0	0	1
0	1	0
1	0	0
1	1	0

# Buffer

**This is not as silly as you might think now, as we'll see later...**

A	Y
0	0
1	1

AND Gate

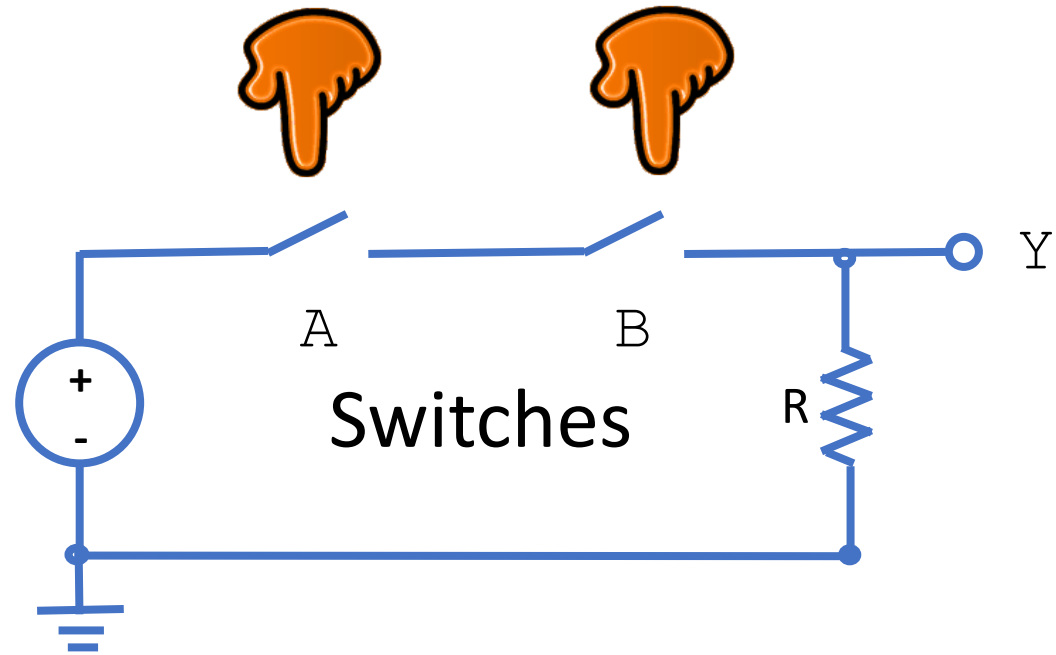

This is just a symbol...

What does it really look like, inside?

How does it work, physically?

When and only when **both** A are B are switched **ON**, Y has **high** voltage.

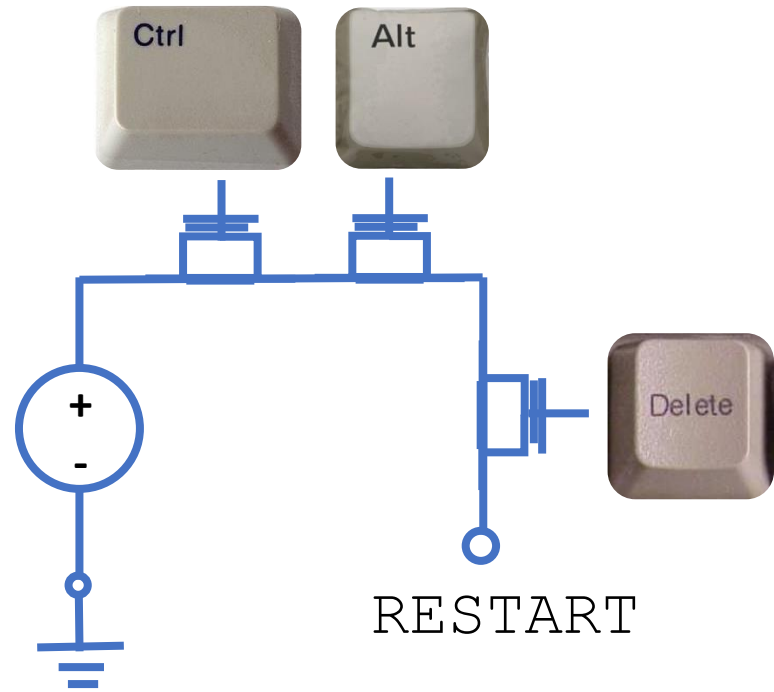

- Gate is like a switch, but controlled by the voltage of the input signal, instead of by a finger.
- Gate A is switched **ON** when signal A is of **high** voltage.
- When and only when **both** A and B have **high** voltage, Y has **high** voltage.
- High voltage is **1 (True)**, low voltage is **0 (False)**.
- **Y is True iff both A and B are True ( $Y = A \& B$ ).**

# Thinking in hardware

- Although CSCB58 has elements that are similar to other courses, it is very different in significant ways
- Unlike other software courses, CSCB58 is not about creating programs and algorithms, but rather devices and machines
  - Very important concept to grasp early in this course!
  - For instance: We need to understand what certain terms mean in the context of hardware.

# Example: Ctrl-Alt-Delete

Ctrl	Alt	Del	RESTART
0	0	0	0
0	0	1	0
0	1	0	0
0	1	1	0
1	0	0	0
1	0	1	0
1	1	0	0
1	1	1	1

Gate is switched ON  
when signal A is of  
high voltage ...

**Why?**

**How?**

What does the inside of a gate look like?

Answer: There are **transistors**

# Transistors

# One of the greatest inventions of the 20<sup>th</sup> century

- Invented by William Shockley, John Bardeen and Walter Brattain in 1947, replacing previous vacuum-tube technology.
  - Nobel Prize for Physics in 1956.

**Building block for the hardware of all  
your computers and electronic devices**

# What do transistors do?

- Transistors connect Point A to Point B, based on the value at Point C.
  - If the value at Point C is high, A and B are connected.

- And if the value at Point C is low, A and B are not.

- **Need to know a little about electricity now....**

**BRACE YOURSELVES**

**PHYSICS AND CHEMISTRY ARE COMING**

imgflip.com

# Outline of the story

- Electricity, basic concepts
- Insulators, conductors, in between ..., **Semiconductors**
- Impure semiconductors, **p-type / n-type**
- Put p-type and n-type together -- **pn-junction**
- Apply voltage to a pn-junction – **principle of transistors**
- A real-world manufacturing of transistor -- **MOSFET**

# Where do transistors fit?

# Electricity Basics

# Everything is made out of atoms ...

- **Protons** are big (hardly move) and positively charged.
- **Electrons** are small (easily move) and negatively charged.
- **Neutrons** are big and, of course, neutral.
- Overall, an atom is **neutral**.

# What is Electricity?

- Electricity is the **flow** of charged particles (usually electrons) through a material.

# How do electrons flow?

They flow ...

# How do electrons flow?

- Electrons want to flow from regions of **high electrical potential** (many electrons) to regions of **low electrical potential** (fewer electrons).
  - Like water flows from high to low.
- This potential is referred to as **voltage** (V).
- The rate of this flow is called the **current** (I).
- Resistance ( $I = V / R$ ) is like how narrow the water pipe is.

# Direction

The direction of the current is **opposite** to the direction of the electron movement, because electrons are **negatively** charged.

# Water Analogy

- To help picture this concept of voltage and current, imagine a reservoir:
  - Electrons flow from high to low potential like water would flow from the reservoir to the ground.
  - Voltage is like the elevation of the water above the ground.
  - Current is the rate at which the water flows.
- The relationship between voltage ( $V$ ) and current ( $I$ ) is called resistance:  $R = V/I$

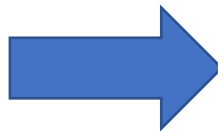

# A Note about Current

- Even though current is caused by electrons flowing through a material, the convention is to measure current as the **movement of positive charges**.
  - *Protons don't actually move*. When electrons move from point A to point B, the result is that B becomes more negative and A becomes more positive.
  - Scientists historically viewed current in terms of this creation of positive charge in a material.
  - It's not completely clear why scientists decided this. Just go with it 😊

# More on Resistance

- Electrical resistance indicates how well a material allows electricity to flow through it:
  - High resistance (aka **insulators**) don't conduct electricity at all.
  - Low resistance (aka **conductors**) conduct electricity well and are generally used for wires.
- **Semiconductors** are somewhere in between conductors and insulators, which makes it interesting...

# Outline of the story

- 
- Electricity, basic concepts
  - Insulators, conductors, in between ..., **Semiconductors**
  - Impure semiconductors, **p-type / n-type**
  - Put p-type and n-type together -- **pn-junction**
  - Apply voltage to a pn-junction – **principle of transistors**
  - A real-world manufacturing of transistor -- **MOSFET**

# Semiconductors

# Here comes the chemistry

## PERIODIC TABLE OF THE ELEPHANTS

# Conductivity of Semiconductors

Semiconductor materials (e.g., silicon and germanium) straddle the boundary between **conductors** and insulators, behaving like one or the other, depending on factors like temperature and impurities in the material.

# Impurity

# Pure semiconductor is pretty stable

- Each atom has **4** valence electrons, forming bonds with other atoms, and the structure is **pretty stable**.
- At room temperature, very close to insulator.

# Encourage semiconductor's conductivity

## N-type:

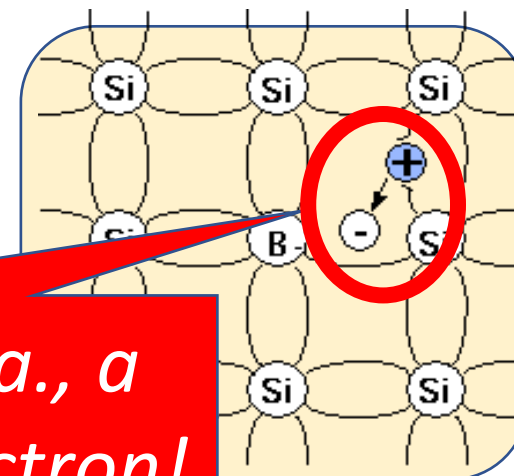

Add some atoms with **5** valence electrons, such as Phosphorus.

*An extra electron!*

## P-type:

Add some atoms with **3** valence electrons, such as Boron.

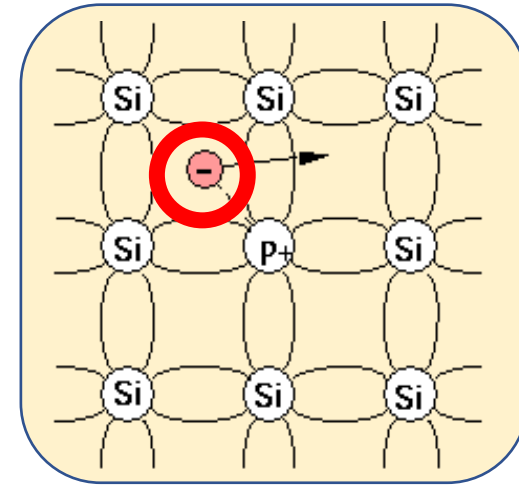

*A missing electron, a.k.a., a "hole", like a positive electron!*

# Encourage semiconductor's conductivity

The extra electrons and the holes are **charge carriers**, which can move **freely** through the materials.

Thus the conductivity is encouraged.

This process of adding stuff is called **doping**, (n or p type).

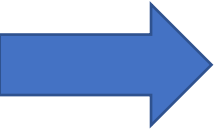

Free electrons move like

Free holes move like

# Outline of the story

- Electricity, basic concepts
- Insulators, conductors, in between ..., **Semiconductors**
- Impure semiconductors, **p-type / n-type**
- • Put p-type and n-type together -- **pn-junction**
- Apply voltage to a pn-junction – **principle of transistors**
- A real-world manufacturing of transistor -- **MOSFET**

# PN-junctions

# Bringing p and n together

- What happens if you brought some p-type material into contact with some n-type material?

- The **electrons** at the surface of the n-type material are **drawn** to the **holes** in the p-type.

# p-n Junctions

- When left alone, the electrons from the n section of the junction will fill the holes of the p section, cancelling each other and create a section with no free carriers called the **depletion** layer.
- Once this depletion layer is wide enough, the doping atoms that remain will create an **electric field** in that region.

Diffusion increases the width of depletion layer, and drift draws it back. An **equilibrium** is reached, when the depletion layer is of a certain width.

**“Diffusion”**

Electrons' initial movement  
(attracted by holes)

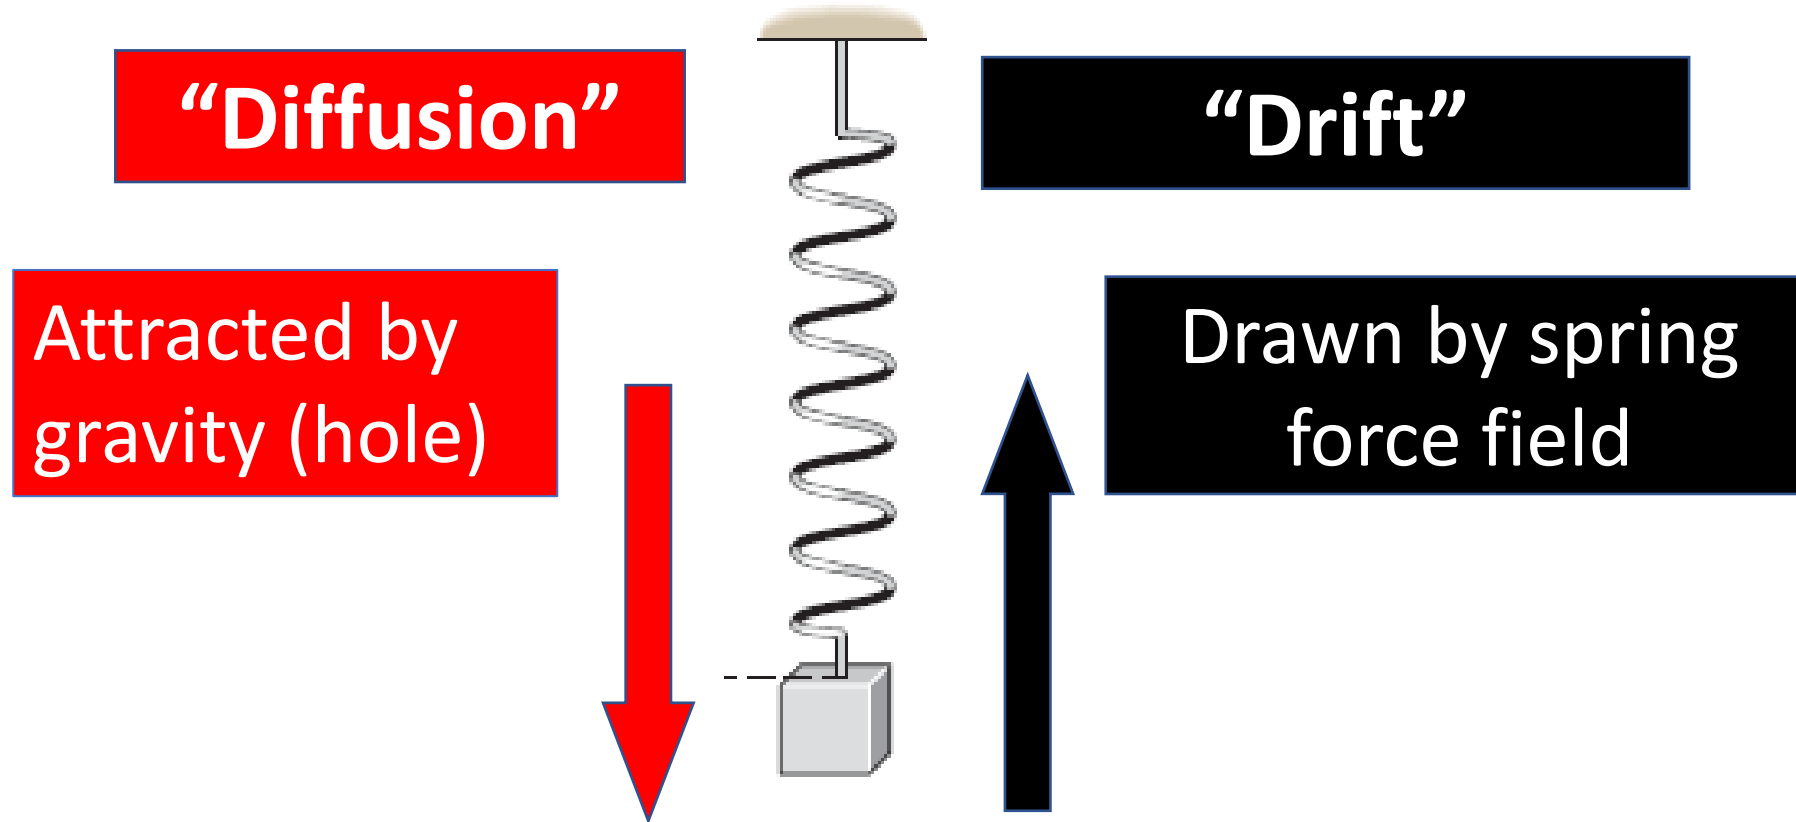

**Electric field**

Electron's movement  
drawn by the electric field

**“Drift”**

# Analogy: Spring with weight

An equilibrium is reached when the spring is stretched by a certain length.

# Summary of pn-junction

When we put **p** and **n** together, they will form a depletion layer with electric field in it.

The depletion layer grows up to a certain **width**, until equilibrium is reached.

# Outline of the story

- Electricity, basic concepts
- Insulators, conductors, in between ..., **Semiconductors**
- Impure semiconductors, **p-type / n-type**
- Put p-type and n-type together -- **pn-junction**
- Apply voltage to a pn-junction – **principle of transistors**
- A real-world manufacturing of transistor -- **MOSFET**

# Apply voltage to a PN-junction

It could be applied in two possible directions

- Positive voltage to the P side
- Positive voltage to the N side

# Forward Bias (Positive voltage to P)

Depletion layer becomes **narrower**

# Reverse Bias (Positive voltage to N)

Negative charges injected into depletion layer

Positive charges injected into depletion layer

Depletion layer becomes **wider**

## Apply **forward bias**

- Depletion layer narrower
- Easier to travel through
- Better conductivity
- Like switch **connected**

## Apply **reverse bias**

- Depletion layer wider
- Harder to travel through
- Worse conductivity
- Like switch **disconnected**

**That's how transistors work!**

# Outline of the story

- Electricity, basic concepts
- Insulators, conductors, in between ..., **Semiconductors**
- Impure semiconductors, **p-type / n-type**
- Put p-type and n-type together -- **pn-junction**
- Apply voltage to a pn-junction – **principle of transistors**
- A real-world manufacturing of transistor -- **MOSFET**

# Creating transistors

- Transistors use the characteristics of p-n junctions to create more interesting behaviour.
- Three main types:
  - Bipolar Junction Transistors (BJTs)
  - Metal Oxide Semiconductor Field Effect Transistor (MOSFET)
  - Junction Field Effect Transistor (JFET)
- The last two are part of the same family, but we'll only look at the MOSFET for now.

# Metal Oxide Semiconductor Field Effect Transistor

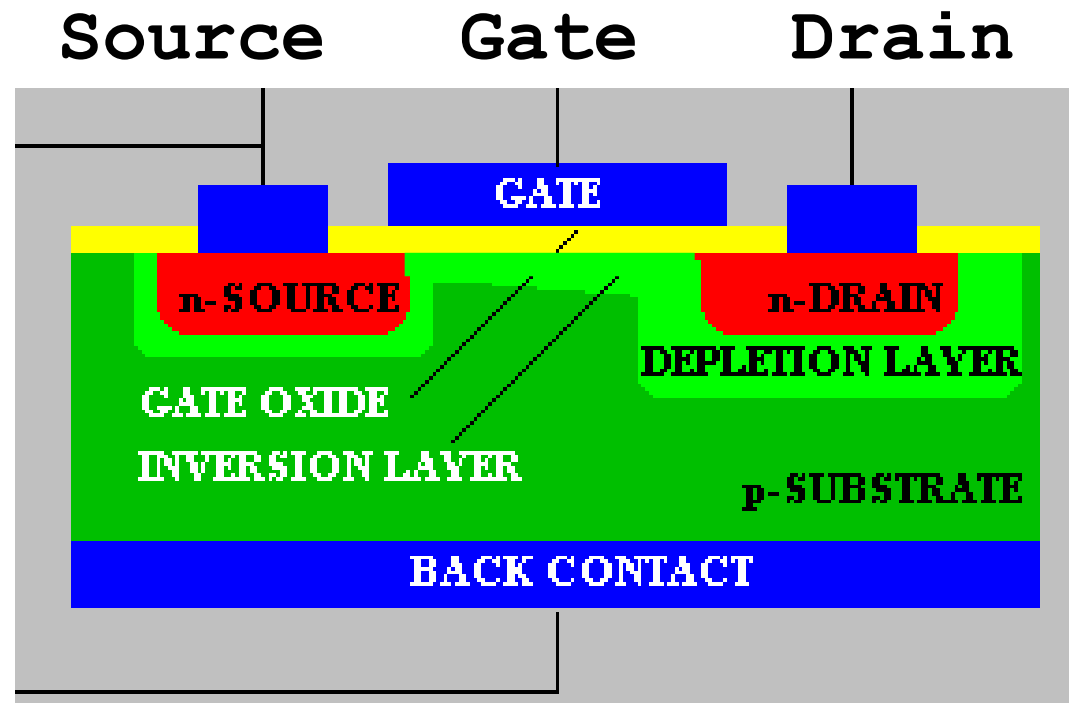

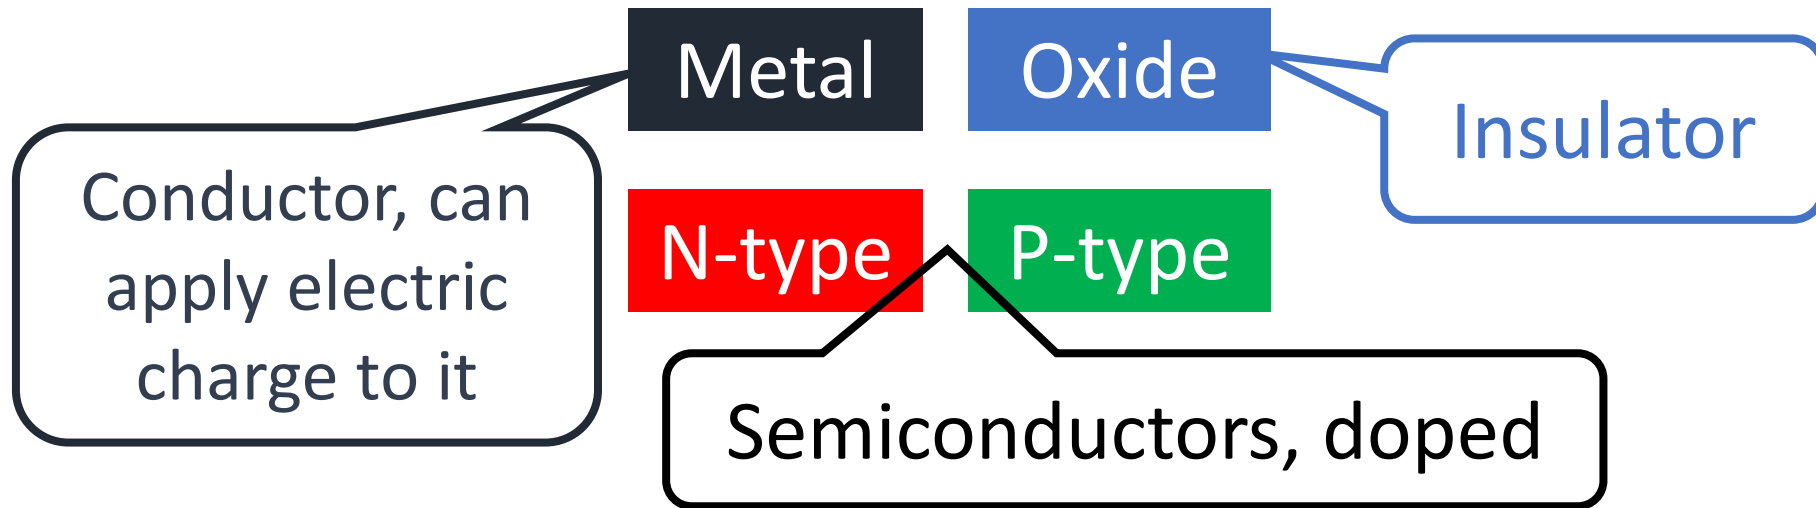

**Gate**

**Source**

**Drain**

# The MO of MOSFETs

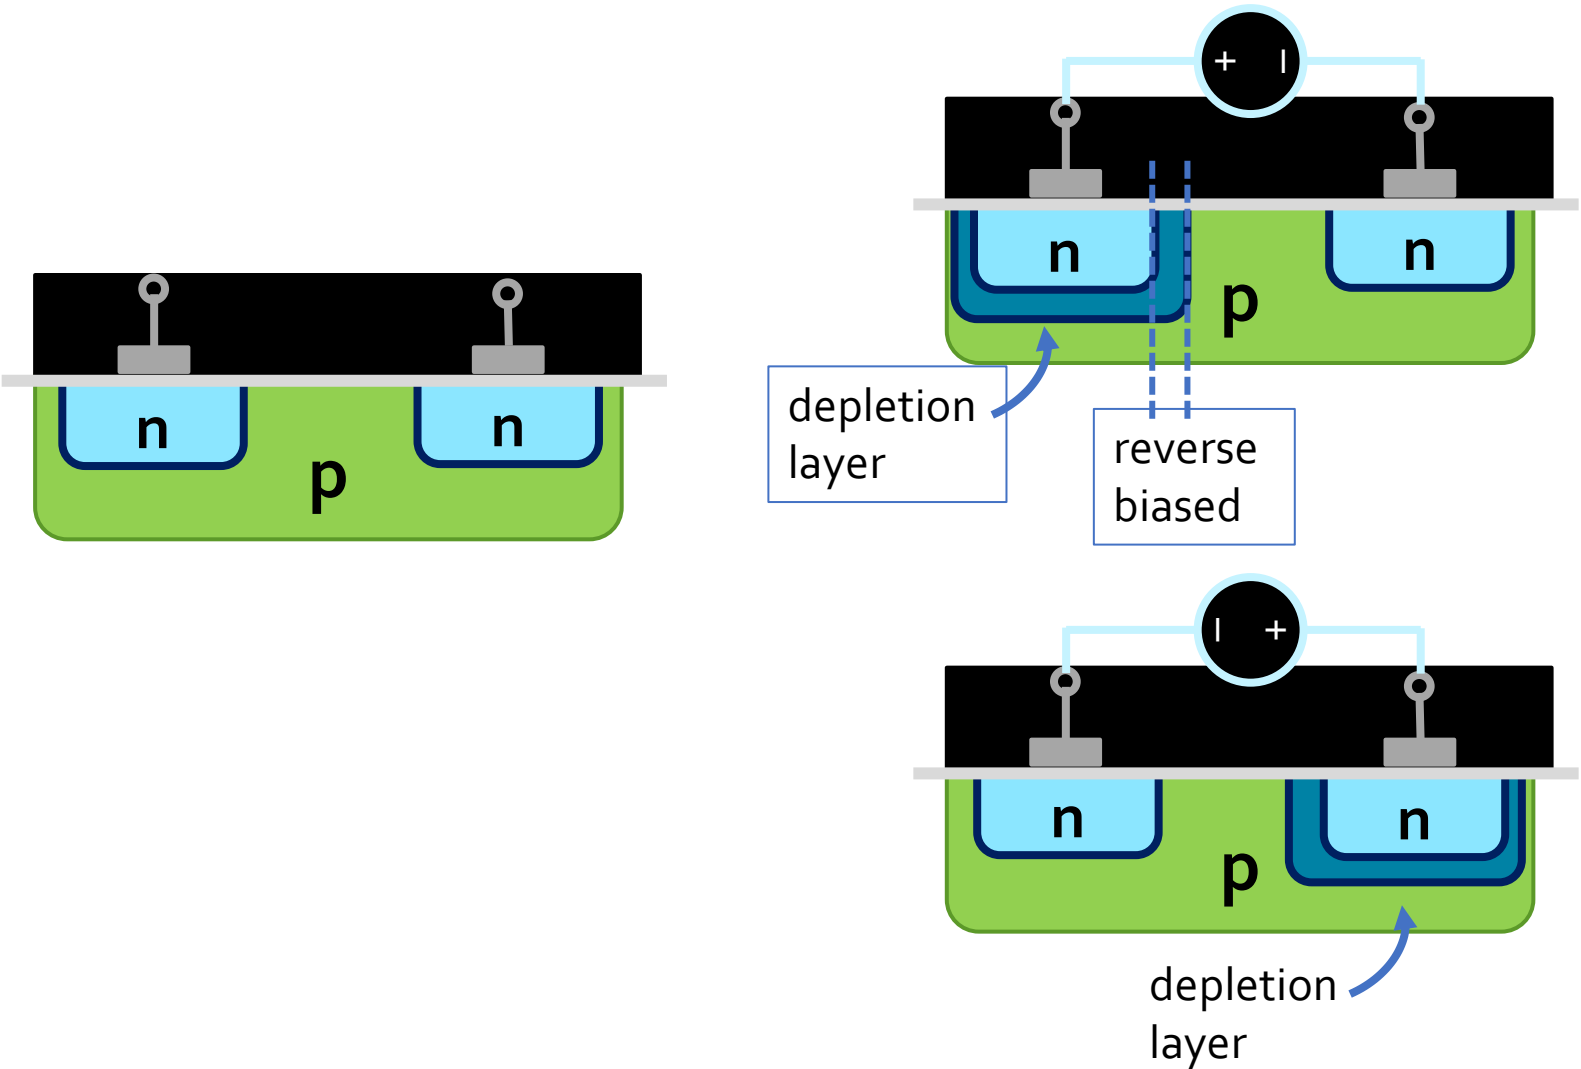

- Metal Oxide Semiconductor Field Effect Transistors are composed of a layer of semiconductor material, with two layers on top of the semiconductor:
  - An oxide layer that doesn't conduct electricity,
  - A metal layer (called the gate), that can have an electric charge applied to it
  - These are the M and O components of MOSFETs.

# The S of MOSFETs

- The semiconductor sections are two pockets of n-type material, resting on a **substrate** layer type material.
- A voltage is applied across the two n-type sections, called the **drain** and the **source**. No current will pass between them though, because the p section in between creates at least one reverse-biased pn junction.

# Applying voltage to NPN

# n-channel MOSFETs

- However, when a voltage applied between the source and the metal plate (the **gate**), positive charges are built up in the metal layer, which attracts layer of negative charge to surface of the p-type material.
- This layer of electrons creates an n-type channel between the drain and the source, connecting the two and allowing current to flow between them.
  - the wider the channel, the higher the current

# Applying voltage to NPN

n-type channel creates path between source and drain for current to conduct!

# nMOS vs pMOS

- Two types of MOSFETs exist, based on the semiconductor type in the drain and source, and the channel formed.
  - **nMOS transistors** (the design described so far) conduct electricity when a positive voltage (5V) is applied to the gate.
  - **pMOS transistors** (indicated by a small circle above the gate) conduct electricity (i.e., act as a closed switch) when the gate voltage is logic-zero.

# Transistors to Logic Gates

# Transistors to Gates

- MOSFETs can make current flow, based on the voltage values in the gate and drain.
  - i.e. the truth table on the right.
- One final step: combining MOSFETS to create high and low voltage outputs, based on high and low voltage inputs.
  - General approach: create transistor circuits that make current flow to outputs from high or low voltage, based on transistor input values.

MOSFET Truth Table

$V_{DS}$	$V_{GS}$	$I_{DS}$
Low	Low	Low
Low	High	Low
High	Low	Low
High	High	High

# Create gates using a combination of transistors

Physical data:

- “High” input = 5V (aka  $V_{cc}$ )
- “Low” input = 0V
- Switching time: ~20 picoseconds
- Switching interval ~10 ns

## NOT Gate

# Transistors into gates

Note:  $V_{CC}$  = "Common Collector Voltage"  
= high voltage (5 V)

AND

OR

XOR

NAND is the most awesome logic gate

- It's cheaper to build
- **All** other logic functions (AND, OR, ...) can be implemented using **only** NAND, i.e., it is **functionally complete**

Challenge for home: implement AND, OR, NOT, XOR using only NAND.

# Transistor Fabrication

- Transistors are not formed by pushing large chunks of n- and p-type semiconductors together.
- Transistors are now made by bombarding silicon with doping substances to create the layers for each junction
  - Surface is oxidized in between stages to ensure that only the necessary sections are doped.

# Fabrication Process
